## ABSTRACT OF THE DISCLOSURE

To provide a hydrogen absorbing alloy having a BCC 10 (body-centered cubic structure) as a crystal structure, and particularly a hydrogen-absorbing alloy for a nickelhydride cell having excellent discharge capacity and durability (cycle characteristics), said hydrogenabsorbing alloy having a composition expressed by the 15 general formula Ti(100-a-b-c-d)'CraVbNicXd, where X is at east one member selected from the group consisting of Y (yttrium), lanthanoids, Pd and Pt, and each of a, b, c and d is represented, in terms of at%, by the relations  $8 \le a$  $\leq$  50, 30 < b  $\leq$  60, 5  $\leq$  c  $\leq$  15, 2 $\leq$  d  $\leq$  10 and 40  $\leq$  a + b + 20  $c + d \le 90$ , wherein the crystal structure of a principal phase is a body-centered cubic structure, and further, the alloy contains at least one of Mo and W in place of V and at least one member selected from the group consisting of Y (yttrium), lanthanoids, Pd and Pt, and its crystal 25 structure is converted to the body-centered cubic structure by heat-treatment.

The state of the s
